"Cloning and recombinant expression of rat and human kynureninase.";

FEBS Lett. 408:5-10(1997).

1- FUNCTION: CATALYZES THE CLEAVAGE OF L-KYNURENINE (L-KYN) AND L-3-

HYDROXYKYNURENINE (L-30HKYN) INTO ANTHRANILIC (AA) AND 3-

HYDROXYKANTHRANILIC ACIDS (3-0HAA), RESPECTIVELY. HAS A PREFERENCE
FOR THE L-3-HYDROXY FORM. ALSO HAS CYSTEINE-CONJUGATE-BETA-LYASE

FOR THE L-3-HYDROXY FORM. ALSO HAS CYSTEINE-CONJUGATE-BETA-LYASE
                                                                                                                                                                                                                                                                                                                    use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).

TISSUE SPECIFICITY: PLASMA.
DOMAIN: COMPOSED OF THREE HOMOLOGOUS DOMAINS.
SIMILARITY: BELONGS TO THE ALB/AFP/VDB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: SERUM ALBUMIN. THE MAIN PROTEIN OF PLASMA, HAS A GOOD BINDING CAPACITY FOR WATER, CA++, NA+, K+, FATTY ACIDS, HORMONES, BILIRUBIN AND DRUGS. ITS MAIN FUNCTION IS THE REGULATION OF THE COLLOIDAL OSMOTIC PRESSURE OF BLOOD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GCYVGFD

                                                                                                                                                                                                 The present invention describes a raffinose synthase, having an activity of forming raffinose from sucrose and galactinol. The raffinose synthase gene can be used for expression in a plant for the production of raffinose. The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence represents a raffinose

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.
         Raffinose synthase;

The sequence is isolated from plant material. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.

                                  This sequence represents rapessed raffinose synthase, a protein that can bind a D-galactosyl group through an alpha(1-6) bond to the hydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. cDNA (see AAZ20210) encoding the enzyme was isolated from rapessed cv. Westar leaf cDNA by PCR. Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain other raffinose synthase genes by labeled detection or amplification (claimed). These genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacterla, corproviding general health advantages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-APR-1998;

Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain other raffinose synthase genes by labeled detection or amplification (claimed). These genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, or providing general health advantages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-APR-1998;

"The receptor for yolk lipoprotein deposition in the chicken occyte.";

J. Biol. Chem. 266:18761-18770(1991).

-i- function: Binds vidl and vig transports them into cells by endocytosis. IN Order to be internalized, the receptor-ligand complexes must first cluster into clatherin-coated pits.

-i- Suscellular Location: Type I membrane protein.

-i- Tissue Specificity: Abundant in Occytes; much less in heart and

"Molecular biology of carbon-phosphorus bond cleavage. Cloning a sequencing of the phn (psib) genes involved in alkylphosphonate uptake and C-P lyase activity in Escherichia coli B.";

J. Biol. Chem. 265:4461-4471(1990).

-i- FUNCTION: BELONGS TO AN OPERON INVOLVED IN ALKYLPHOSPHONATE UPTAKE AND C-P LYASE. EXACT FUNCTION NOT KNOWN.

-i- MISCELLANEOUS: THE SEQUENCE SHOWN IS THAT OF STRAIN K12.
